## STAUFF Valves

With the STAUFF Valves product range, the companies of STAUFF Group provide access to a comprehensive range of manually operated valves for shutting off, regulating, throttling and fluid media in mobile and industrial hydraulics.

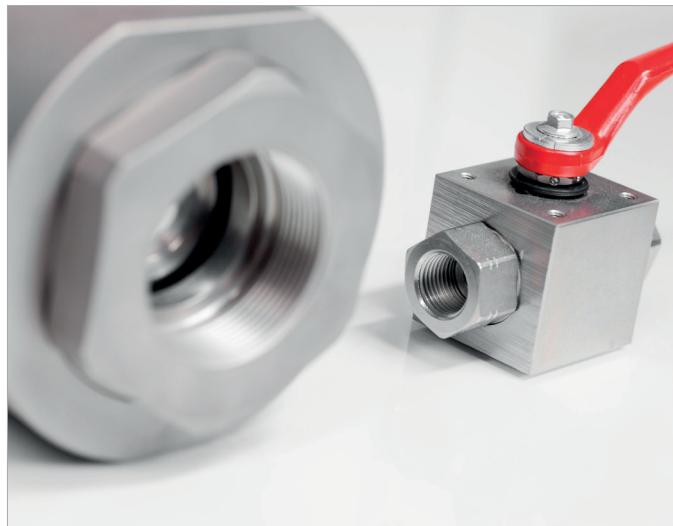

The portfolio includes two-way, three-way and four-way ball valves of various designs and sizes made of steel or stainless steel for medium and high pressure applications.

The product range is completed by flow control valves (such as throttle valves and check valves) for in-line assembly, manifold mounting and cartridge assembly, as well as single-station and multi-station gauge isolator valves.

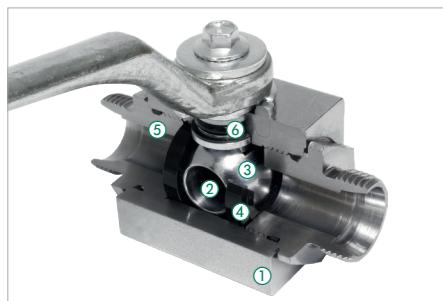

For special applications, STAUFF is able to provide technically modified products that will, for example, cover extreme pressure ranges up to 800 bar / 12000 PSI and temperatures up to +500°C / +930°F.

For these and other customised solutions according to customer's specifications or based on our in-house development, STAUFF guarantees prompt service.

## Flow Characteristics

Please note:

The flow characteristics displayed on this page are valid for mineral oils with a density of 0.86 kg/dm<sup>3</sup> and the kinematic viscosity of 35 mm<sup>2</sup>/s (35 cSt).

The characteristics have been determined in accordance to ISO 3968.

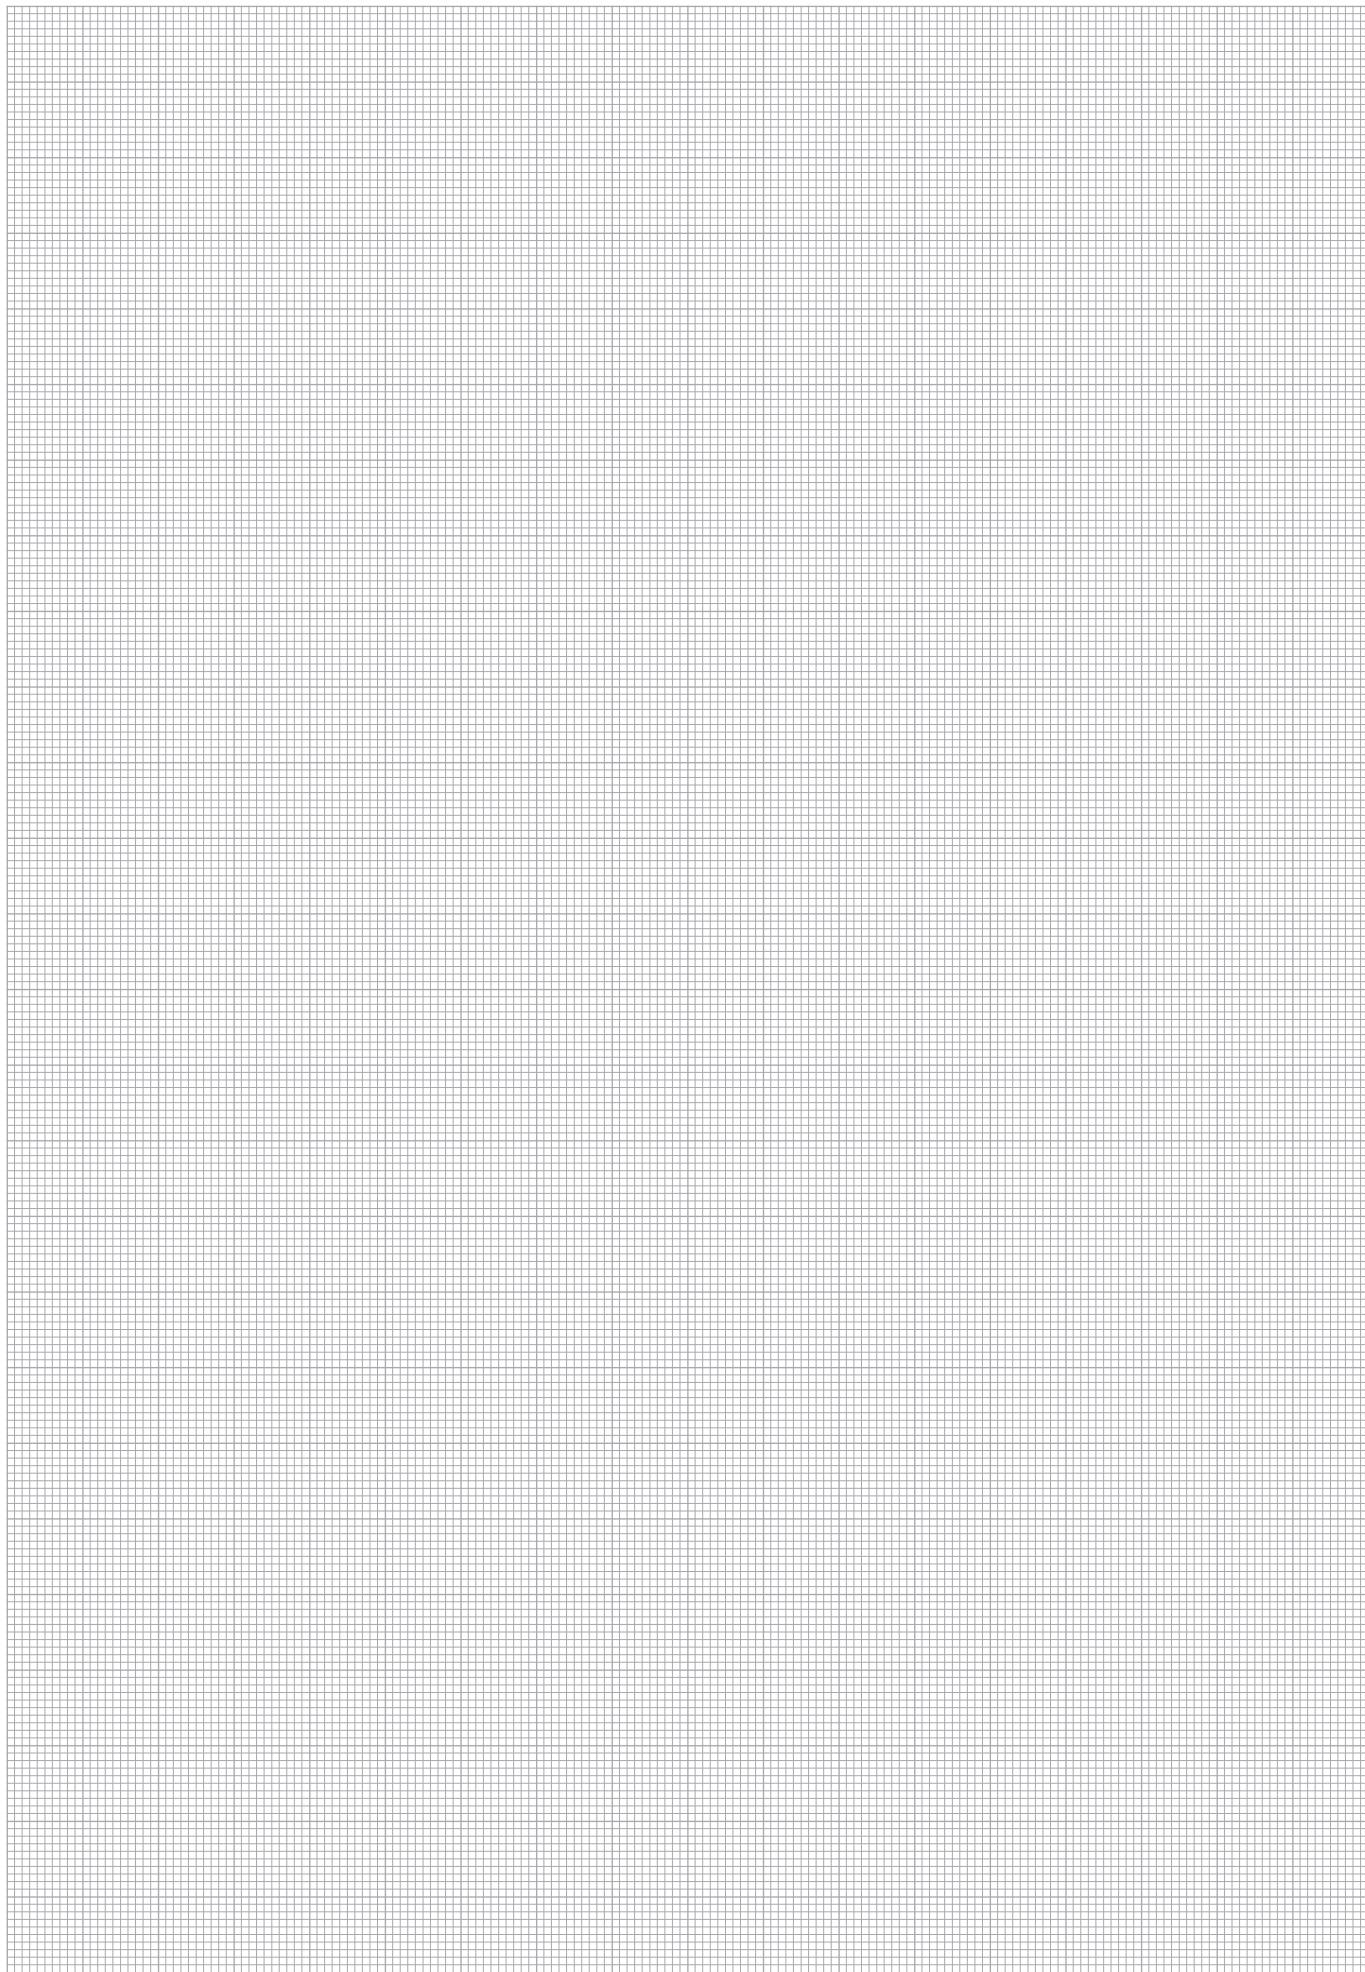

<sup>1</sup>Due to spring and manufacturing tolerances cracking pressures may deviate by ± 30%

<sup>2</sup>Leakage rate of check valve DIN EN 12266 - leakage rate C-D (test medium water)

<sup>3</sup>Flow control valves should not be used as shut-off device. Small leakage rates may occur in fully closed position. (DIN EN 12266 - leakage rate A-B - test medium water)

## Highest-Pressure Ball Valves

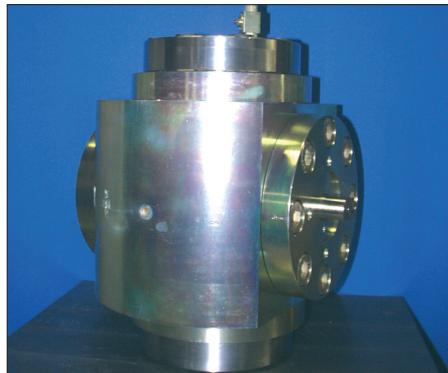

**E**  
800 bar / 1200 PSI ball valve combination for alternating pressure demands from 6 bar / 87 PSI up to 800 bar / 12000 PSI working in a hose testing plant.

The STAUFF range of valves have stood the test of time for ultra high pressure applications up to 800 bar / 12000 PSI.

The high demands on ball valves will be maintained through the utilisation of high quality STAUFF specified materials. The extreme loads on the seals caused by the high pressures will be absorbed by a special chambering of the seals. Additionally the sealing system is protected against erosion and therefore rapid wear.

The ball valves are utilised in Test Stations, Steel Works, Cleaning and Cutting Systems.

**Ball valve for a test bed:** The customers demand was to apply high pressure and great volume to the specimen in a short time.

**Descaling of steel sheets and profiles.**

### These valves are being utilised:

#### For High pressure water blasting

- internal cleaning of reactors, containers and mixers
- sewer cleaning
- pipe cleaning
- surface treatment like chamfering, descaling, varnish removal

#### For process and industrial technology

- CO<sub>2</sub> – extraction
- hydroforming
- test bed technology
- water jet cutting systems

## High-Temperature Ball Valves

**High temperature ball valves with heating elements for polymer production.**

In order to provide the many advantages of ball valves in high temperature applications, STAUFF has developed the FBVT series of ball valves.

These valves are designed with a gland packing of special material. This sealing allows applications with high pressure and simultaneously high temperatures.

Up to a temperature of +260 °C / +500 °F high quality plastic seats are being utilised. These are suitable for high pressure and temperature loads due to their proven chambering.

For temperatures up to +500 °C / +932 °F STAUFF has developed a special sealing system with metal seats. Despite the additional demands on compression, wear and corrosion under high temperatures, the leak rate of these ball valves can be compared with standard valves.

## Ball Valves for Gas Applications

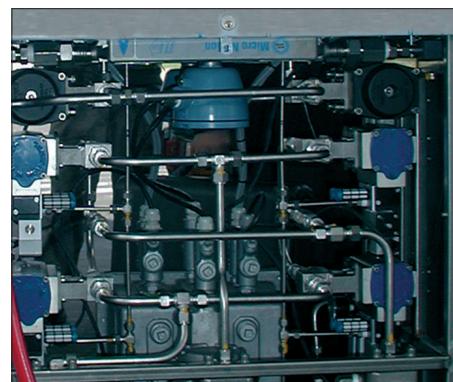

**STAUFF ball valves are used for many gas applications, such as:**

- General gas supply systems,
- Filling plants,
- compressor stations,
- gas stations,
- analysis equipment

The design follows the Pressure Equipment Directive 97/23/EC.

The ATEX Directive for hazardous location EX II 2G c will be proved in single test on demand.

The materials for body, ball and seals are dependant on the gas and application in consideration of the directives.

Further ball valves up to DN 200 with flange connector, as well as 3/2-way-selector ball valves, multi-way ball valves and ball valves for manifold mounting and cartridge ball valves are also available.

The requirements and tests are in accordance to DIN 3230 Part 5, test group PG1 or PG2, Material and test certificate DIN EN 10204-3.1, Certification to Pressure Equipment Directive 97/23/EC.

The leaking rate can be proved with a Helium leakage test device up to a leakage rate of  $10^{-9}$  mbar x l/sec.

STAUFF recommends the use of the version with erosion protection ring in order to extend the lifetime of the seats look page 130.

Only if the most important parameters like pressure, medium, temperature, medium concentration and operation cycles are known the best or most suitable material combination and the most economical solution can be offered.

Except the general suggestions for the material combinations the chemical resistance and further directives are to be considered. For Fluids like oxygen, hydrogen, argon, helium and sour gas we request a contactation.

Sour gas application: For fluids with hydrogen sulphide (H2S) – parts ball valves can be delivered in accordance to the NACE Standard MR0175.

Double block and bleed valve for sampling.

Filter station for the filtration of gases with STAUFF 3-way-selector ball valves for 250 bar / 3600 PSI and +200°C / +392 °F.

#### Gas stations:

For gas pumps both ball valves with floating ball and with trunnion ball are suitable. Most important for the design are the frequency of operation cycles in use with actuators. Assembling of actuators to ISO 5211 or direct mounting.

In case of maintenance the gas flow is diverted by a 3-way-selector valve combination allowing the filter elements to be changed. Due to the excellent KV-value this valve is the ideal switch over unit for use in high leak-tightness application.

#### Ball valves for analysis techniques and Sampling

Ball valves are deliverable as "double block and bleed valve". Part of this product range are the TALFIRE – ball valves. These ball valves meet the requirements of the TA-Luft (technical directive for clean air). They are used in applications with air pollution substances.

## Ball Valves for Paints and Lacquers

**Ball valve application in airless spraying device.**

E

Ball valves for paints and lacquers must be resistant against the varying viscosities and dye particles in the fluid.

The sealing material is the determining factor to guarantee an optimal lifetime. The choice of the seals is depending on the required operating cycles and after consideration of the pressure differential.

In case of operating the ball valve without differential pressure, standard ball seats can be used.

To increase the lifetime we recommend a seat version with erosion protection ring. For a further increase of the lifetime and also a reduction of repair and maintenance time, a metal seat is the best solution.

The specified material combinations are suitable for most applications.

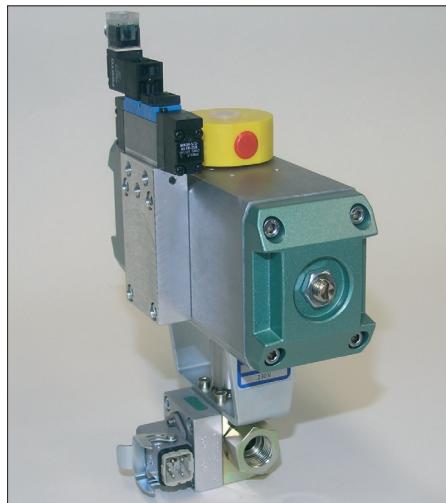

The chemical resistance to the used solvent has to be tested when selecting the ball valve.

To maintain or repair the valve, it is necessary that the return and non-return lines in colour spraying plants can be blocked off.

Due to the opening of the bypass ball valve, an un-pressurised circulation has to be guaranteed.

The locking or opening of the bypass line is carried out manually, thereby incorrect operation is impossible.

## Ball Valves for Isocyanates

Isocyanates react with humidity and develop crystalline particles. To avoid that the isocyanates get in contact with environmental humidity, the ball valves have to be completely leakproof.

On the other hand the crystalline particles in the fluid mustn't damage the ball seats. Special seats are used because standard plastic seats can be damaged by crystalline particles.

With these sealing system from STAUFF a ball valve provides extended lifetime.

These valves are being used in the foaming systems and pasters. Ball valves are also available with heating devices and temperature sensors in order to keep the temperature regulated during the manufacturing process.

Equipped with actuators and limit switches STAUFF ball valves being operated in many instances by robots.

**Ball Valves with Fire-Safe Approval**

When handling flammable liquids safety must be a prime consideration. Great importance is therefore attributed to the design of "fire-safe" shut-off valves utilized in many industrial environments including:

**This is most important for:**

- Chemical Plants
- Petrochemical Plants
- Oil Drilling
- On-Shore and Off-Shore Installations
- Oil Refineries

When fire does break out, it is important that it does not spread through failures in pipe-work systems. Even under the most extreme conditions shut-off valves must provide:

- Secure Operation
- Reliable Sealing in shut-off position
- Reliable Sealing to the outside

Due to their quarter turn shut-off design, STAUFF ball valves provide a solution to meet these demands.

Metal seat edges at the ball seats guarantee the sealing function during and after contact with fire, even if the seals themselves are burnt.

In addition both housings and shafts are also sealed with heat resistant seats ensuring their continued operation.

The "fire-safe" test undergone by STAUFF ball valves subjected them to flames and a resulting temperature of +760 °C / +1400 °F where the ball valve is heated to a general temperature of min. +650 °C / +1202 °F.

The STAUFF "fire-safe" design ensured that after this burn period of 30 min. the valves remained operable and that a continued "emergency" sealing of the valve could be guaranteed.

The test conditions under which "fire-safe" requirements are specified are characterised in various international standards.

STAUFF ball valves of the BBV series have been tested successfully according to British Standard BS 6755 T.2, API 6 FA and ISO 10497. The tests were testified by the German TÜV Inspectorate.

At this time, certification as "fire-safe" relates to our BBV series with threaded connections and nominal sizes from DN 25 to DN 50 and the BBV series with flange connections and nominal sizes from DN 25 to DN 125 and within a nominal pressure range from 260 ... 420 bar / 3700 PSI ... PN 6000 PSI.

The material utilized for the soft seals in "fire-safe" valves remains dependant upon the required chemical resistance to suit the fluid, the application and operation conditions.

A wide variety of ball valve terminations are available from STAUFF to suit the individual applications or requirements and additionally other characteristics such as antistatic design can be incorporated within the STAUFF product.

**Ball Valves For Steel Mill Applications****Pressure Equalizing Ball Valve**

Large, high pressure ball valves are difficult to open under pressure, especially when closed for a long period of time. Solutions to this problem have included multiple valves with bulky, external plumbing.

The STAUFF Pressure Equalizing Ball Valve adds an integrated valve mounted directly to the valve body and connected internally with no extra fittings or pipework.

Once the lockable bypass valve is opened pressure on both the upstream and downstream side of the main ball valve is equalized. This can reduce the torque required to operate the valve by up to 70%.

This also reduces the potential for damage to the valve caused by excessive breakaway torque.

**System Service Bleed Valve**

Safe depressurization is a critical step in the maintenance of a hydraulic system. In many countries maintenance personnel are required to lock-out and tag hydraulic circuits before any maintenance work is carried out.

Assure that this process is carried out safely and properly during routine machine maintenance using the STAUFF System Service Bleed Valve.

The valve can only be locked and tagged-out in the closed position after the integrated bleed valve has been operated and the affected portion of the hydraulic system has been depressurized. The interlocking cam plates ensure the correct operating sequence.

## Double-Acting Pneumatic Actuators ▪ Type AD

## Single-Acting Pneumatic Actuators ▪ Type AS

## Electric Actuators ▪ Type AF

Most STAUFF ball valves can be factory-mounted to compact and efficient pneumatic or electric actuators for both high-pressure and low-pressure applications.

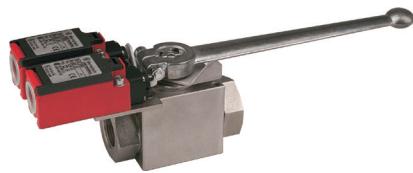

The actuators feature simple, robust construction and are suitable for applications with high cycle requirements.

Please note: The minimum air supply for pneumatic actuators is usually 5,5 bar / 80 PSI. They are designed for 90° open / close applications only and should not be used for valve throttling.

## Nomenclature Definitions

### Nominal Pressure PN

The nominal pressure indicates the pressure rate of a hydraulic component and continuous dynamic application. The number is rounded up in order to comply with the internationally specified terms.

These nominal pressure values are internationally recognised and assist to appoint common component dimensions. For all ball valves conform to a design and test pressure  $1.5 \times PN$  according to DIN 3230 T5 and ISO 5108 for body. For ball seats we admit  $1.1 \times PN$ .

The nominal pressure specifies the admissible working overpressure at  $+20^\circ\text{C} / 68^\circ\text{F}$ . Please consider the pressure reduction at higher temperature.

### Maximum Working Pressure $P_{\max}$

$P_{\max}$  is the maximum working pressure of a component including pressure peaks for limited duration of dynamic application resp. the maximum working pressure which considers temperature reduction ratings.

### Burst Pressure $P_{\text{Burst}}$

The safety factor for burst pressure tests is a minimum of 2.4 times the nominal pressure.  
 $P_{\text{Burst}} = 2.4 \times PN$

### Nominal Diameter DN

The nominal diameter is a numeric dimension of mating parts without indication of outer tube diameter or thread size, for example flanges. The nominal diameters match approximately the clear diameter of the ball valves in mm. Reduced diameters are marked by STAUFF with for example DN25/32. That corresponds to the ball valve being DN 25 and the adapter being DN 32.

### Leakage Rate

Leakage rate of ball valves with synthetic ball seats: DIN EN 12266 leakage rate A  
 (No visually noticeable leakage during the duration of the test with fluid or air).

## Determination of the Nominal Diameter

### Using a Nomogram

This nomogramm provides a guide for the determination of the nominal diameter (DN). We recommend to use the following flow rates as a basic guideline:

Suction lines: 0,5 ... 0,8 m/sec (.15 ... .24 ft/sec)  
 Return lines: 2,0 ... 4,0 m/sec (.61 ... 1.22 ft/sec)  
 Pressure lines >10 MPa: 2,0 ... 4,0 m/sec (.61 ... 1.22 ft/sec)  
 Pressure lines >50 MPa: 3,0 ... 12,0 m/sec (.91 ... 3.66 ft/sec)

#### Example 1

Velocity  $v = 8$  m/sec (2.44 ft/sec)  
 Flow rate  $Q = 150$  l/min (40 US GPM)

The straight line linking these two values on the outer scales intersects the nominal diameter DN 20 on the middle scale.

#### Example 2

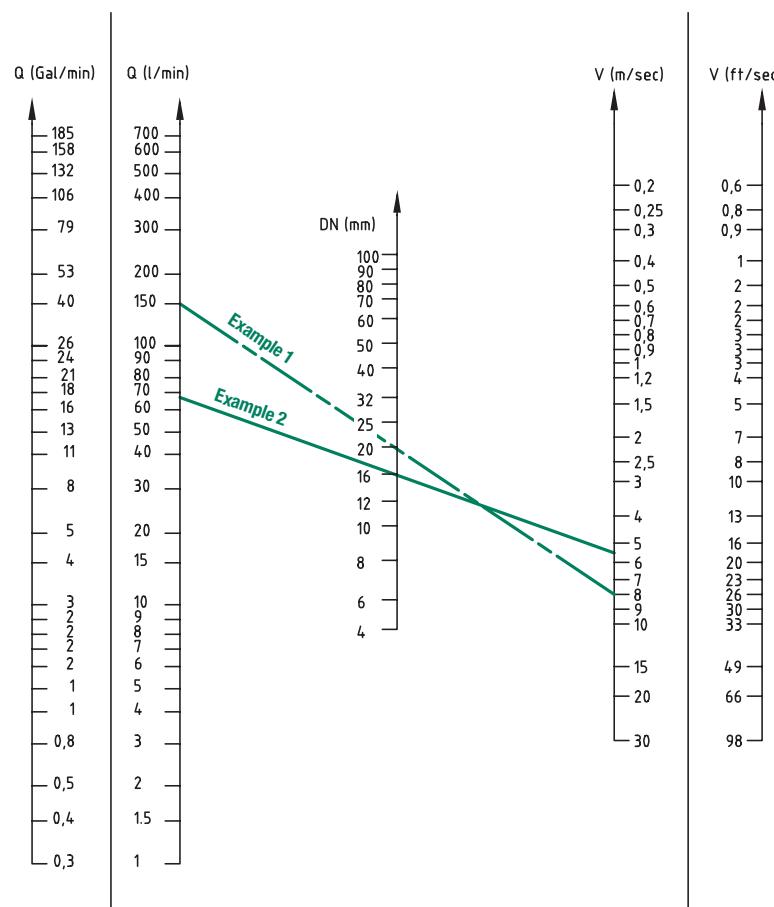

Velocity  $v = 5,5$  m/sec (1.68 ft/sec)  
 Flow rate  $Q = 66$  l/min (17 US GPM)

The straight line linking these two values on the outer scales intersects the nominal diameter DN 16 on the middle scale.

#### Please note:

No allowance is incorporated for the resistance of the pipes, elbows and valves, viscosity, the effect to temperature on viscosity and other factors.

Contact STAUFF for further information.

## Determination of the Nominal Diameter

### Using a List of Nominal Flow Rates

The indicated flow rates have been determined for ball valves in open position with water at a temperature of +15°C / +60°F.

#### $K_v$ Coefficient

The nominal flow rate coefficient  $K_v$  according to German standard VDI/VDE 2173 indicates the quantity of water in cubic meter per hour ( $m^3/h$ ) at

$$\Delta p = 1 \text{ bar} / 14.5 \text{ PSI and } 35 \text{ mm}^2/\text{s (cSt)} \\ \text{at } +5 \dots +30^\circ\text{C} / +41 \dots +86^\circ\text{F.}$$

#### $C_v$ Coefficient

The  $C_v$  value (which is still common practice in USA) specifies how much US gallons of water flow through the valve per minute (US GPM) at

$$\Delta p = 1 \text{ bar} / 14.5 \text{ PSI at } +15^\circ\text{C} / +60^\circ\text{F.}$$

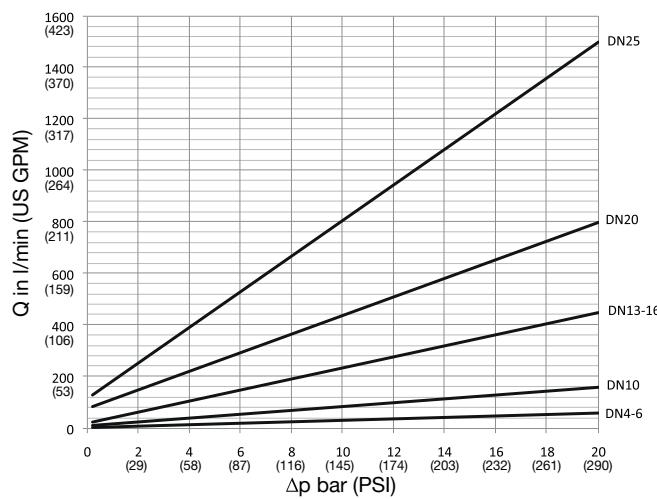

Contact STAUFF for further information.

## Pressure Equipment Directive CE-Marking of STAUFF Valves

**Information about essential contents and consequences of the Pressure Equipment Directive (PED 97/23 EC) and the CE-marking for STAUFF valves**

From 29th May 2002 the application of the Pressure Equipment Directive (PED 97/23 EC) is mandatory throughout in the European Community.

### Responsibility

Manufacturers are obliged to ensure that products which are placed on the market in the European Community are designed and manufactured according to the regulations of the Pressure Equipment Directive.

The company is only allowed to purchase and use pressure equipment which corresponds to the regulations of the Pressure Equipment Directive.

### Procedure

Valves have to be classified in categories (category I to III). Category I relates to the lowest, category III to the highest, hazard category.

The classification is carried out under consideration of

- diameter
- pressure
- medium-hazardous or harmless gases or liquids

Group 1 comprises hazardous mediums

- explosive
- extremely flammable
- highly flammable
- flammable (where the maximum allowable temperature is above flashpoint)
- very toxic
- toxic
- oxidising

Group 2 comprises all harmless mediums which are not listed in Group 1 such as hydraulic oil, water, air and oxygen.

### Consequences

**No CE-marking for:**

- All valves < DN200 for harmless liquids of Group 2, such as hydraulic oil, water
- All valves up to and including DN 25 for all mediums in Group 1 and 2 (gaseous and liquid)

**CE-marking for valves  $\geq$  DN 32:**

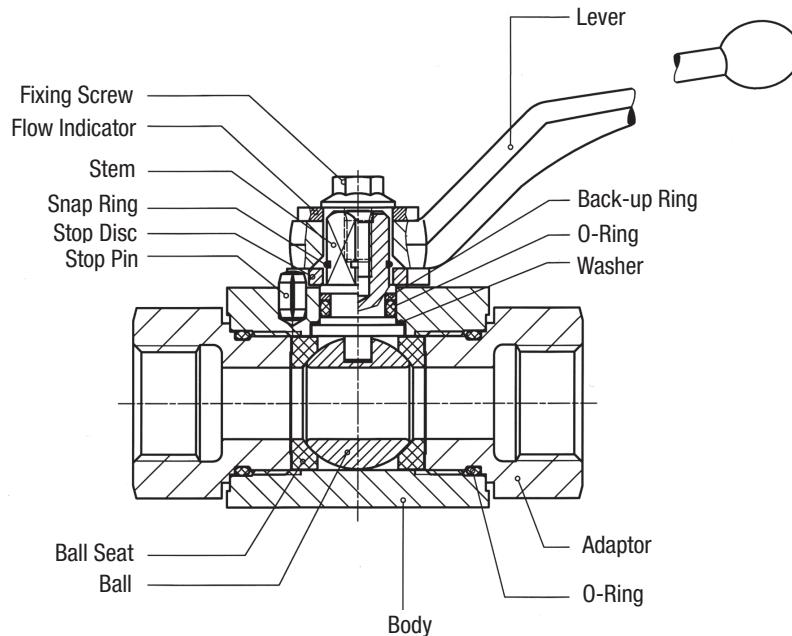

- With regards to valves of category I and II, STAUFF prepares a declaration of conformity.
- With regards to valves of category III an external conformity examination is necessary.
- The resulting costs will be included in our quotation.

Concerning valves of the categories I to III, it has to be observed that:

- a certification of conformity has to be enclosed with each delivery.
- operating instructions have to be enclosed with each packing unity.
- the traceability of products must be guaranteed.

## Storing and Assembling Instructions

The assembly of the lever and the flow indicator has to be carried out the way that the groove of the stem and the groove of the indicator are identical in direction.

STAUFF delivers ball valves of first-class quality. This is guaranteed by the utmost care as far as construction and production of our products are concerned. All STAUFF products must pass our rigid quality assurance system ensuring the high standard of quality. As a matter of course, quality approvals can be supplied on request.

In order to guarantee the proper function of our products, the following criteria must be adhered to (non-observance can lead to expiration of this guarantee):

1. After receipt of order, the goods must be kept from moisture, erosion and thermal shock.
2. Ball valves are being delivered in open position. Store in a dry and clean place. Do not remove protective dust caps until final installation.
3. Pipe systems must be flushed before installing ball valves (dirt and other residues can damage seals).
4. It is possible to change the switching direction from our standard „clockwise“ to „counter clockwise“ by reversing the stop disc (see illustration).
5. When mounting pipes or fittings to the ball valve, the valve connectors must be held in place at the hexagon with a suitable tool (open end wrench) to prevent expanding the end connectors.
6. Pressure test max. with  $1,1 \times PN$  with closed ball valve;  $1,5 \times PN$  in half opened position.

Flanged ball valves and ball valves in larger nominal diameters must be carefully aligned with pipe to prevent line stress. When welding ball valves into the pipe system, the temperature at the body must not exceed  $+200^\circ\text{C}$  /  $+392^\circ\text{C}$ .

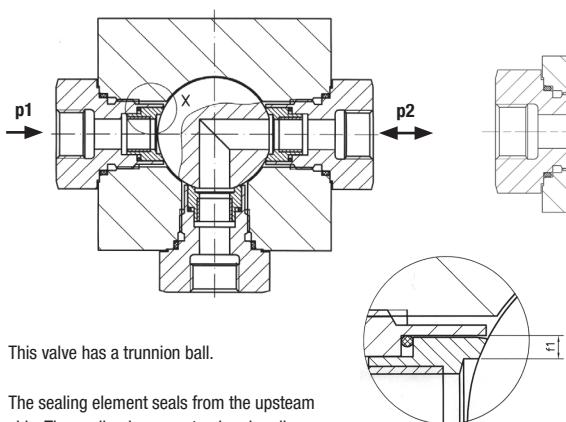

When bleeding a pipe system, the ball valve must be opened  $45^\circ$  to assure complete drainage.

In case of a defect please contact the factory prior to disassembly of our ball valves.

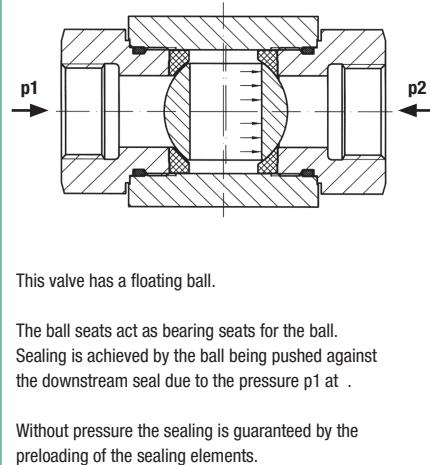

## Sealing Variations

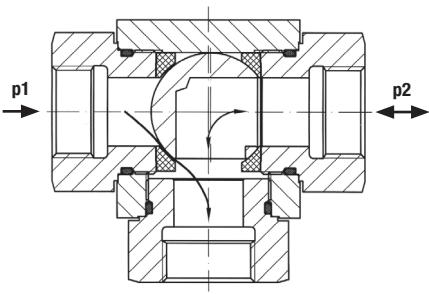

### Multi-Way Ball Valves

### Two-Way Ball Valves (Type LBV)

### Three-Way Ball Valves (Type CBVL)

### Three-Way Ball Valves (Type CBVSL)

The selector ball valve has 2 front side sealing seats and a floating ball.

$p_1 > p_2$

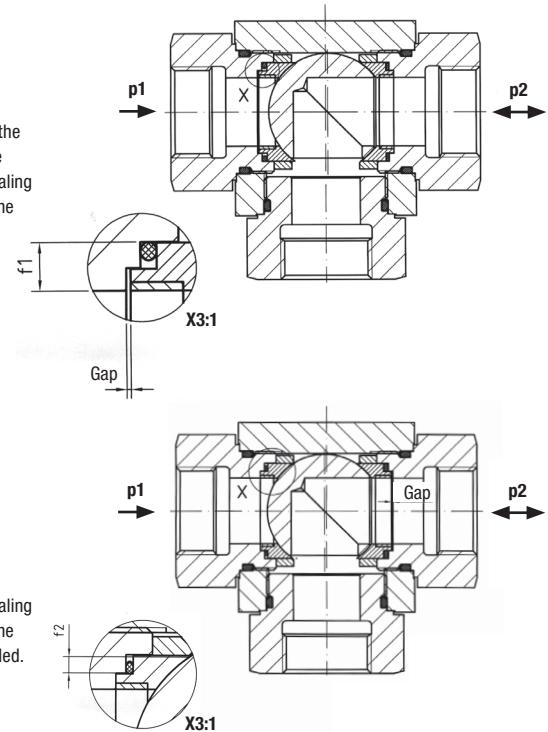

Due to the forming of the ring surface „f1“ and the pressure ( $p_1-p_2$ ) the left sealing element will be forced against the ball and consequently the sealing is achieved. The „floating“ ball moves against the right sealing surface - the ball valve remains sealed.

**Pressure inlet possible from all ports!  
Must be operated without pressure!**

$p_1 < p_2$

Due to the ring surface „f2“ and the pressure ( $p_2-p_1$ ) the right sealing element will also be forced against the ball and consequently the sealing is achieved. The „floating“ ball moves against the left sealing surface - the ball valve remains sealed.

**Pressure inlet possible from all ports!  
Must be operated without pressure!**

For compressible and abrasive media special protected seats are utilised.

During the first part opening of the ball valve, standard plastic seats are located unprotected in the critical cross sectional area.

During gas applications and with all kinds of compressive media this narrowest cross section can result in a very high flow rate that cause erosion of the seats.

If media contain solids, for example paint, the abrasion risk in the first opening section is extremely high.

Ball valves with standard seats can quickly become inoperative.

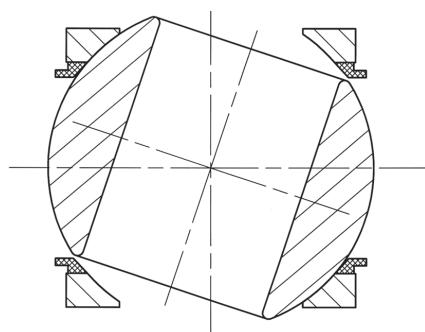

For this application, STAUFF has designed a sealing version with erosion protection ring. This ring is made of special material and keeps the high flow forces and the abrasive solids away from the plastic seals.

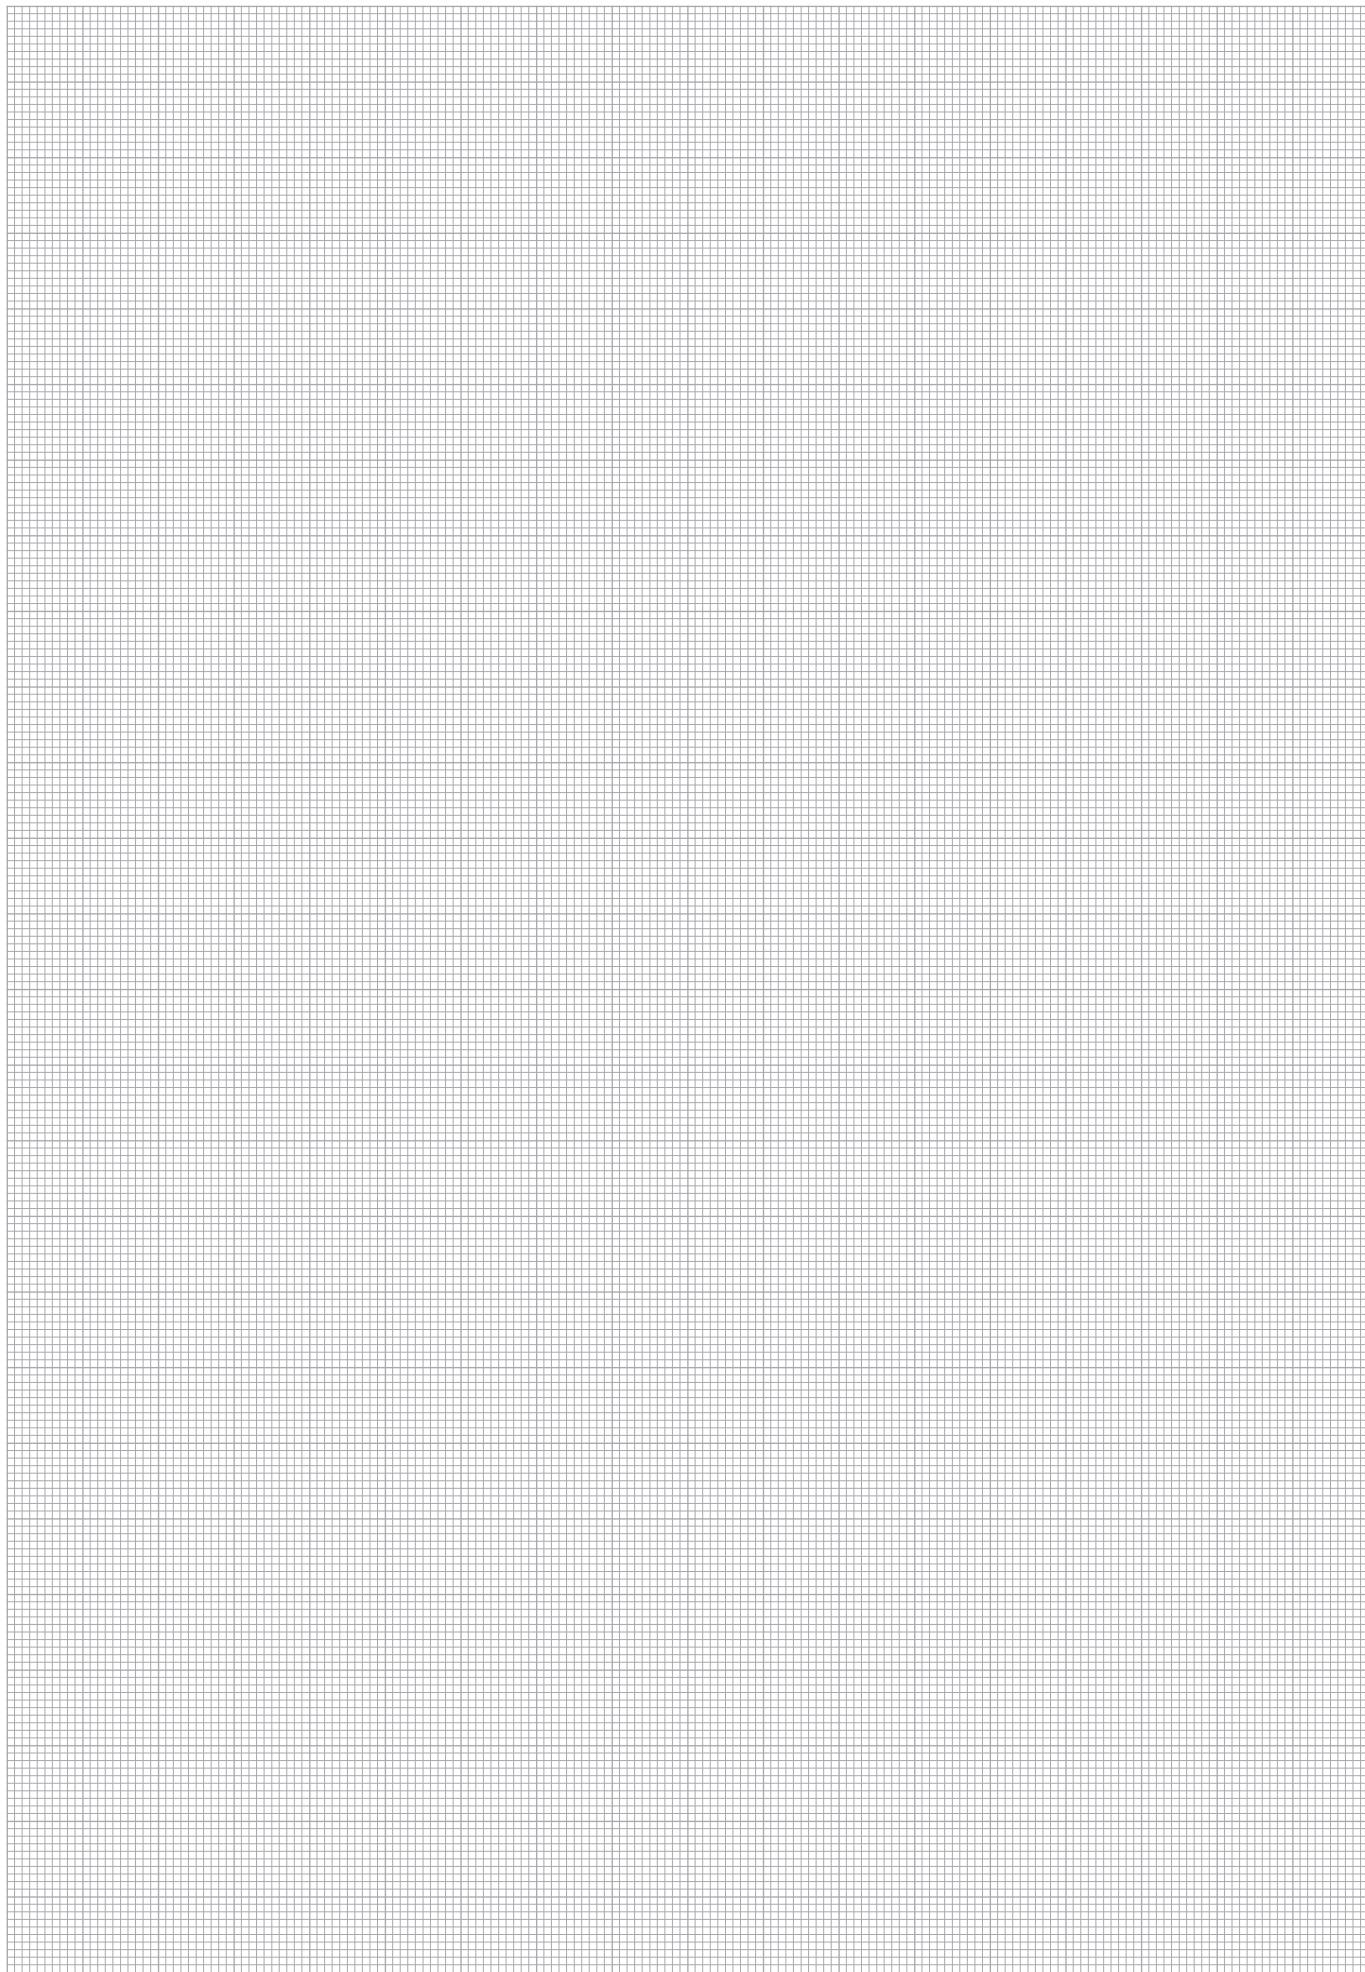

Tests and long term experience with this application have shown that ball valves with this sealing system provide substantially improved life times.

Times of non-use as well as maintenance and repair times are therefore reduced.

A further increase of the lifetime is possible by using metal seating elements.
